Linear elasticity: a brief reminder. A force applied to a rubber band extends it or curves it. In general, a force applied to different parts of an elastic body changes the mutual location of its points. Once we know the forces applied at different locations, we can determine the deformations – and, vice versa, we can determine the forces once we know all the deformations. In general, the dependence on forces \( f_i \) at different locations on different displacement is non-linear; however, when displacements are small, we can ignore terms quadratic or higher order in terms of \( \varepsilon_j \) and thus safely assume that the dependence of each force component \( f_{\alpha} \) on all the components \( \varepsilon_{\beta} \) of displacements at different locations is linear. Taking into account that in the absence of forces, there is no displacement, we conclude that
\[
f_{\alpha} = \sum_{\beta} K_{\alpha,\beta} \cdot \varepsilon_{\beta}
\]
for some coefficients \( K_{\alpha,\beta} \). These coefficients describe the mechanical properties of the body. It is therefore desirable to experimentally determine these coefficients.

Ideal case. In the ideal case, we measure displacements \( \varepsilon_{\beta} \) and forces \( f_{\alpha} \) at all possible locations. Each such measurement results in an equation which is linear in terms of the unknowns \( K_{\alpha,\beta} \). Thus, after performing sufficiently many measurements, we get an easy-to-solve system of linear equations that enables us to find the values \( K_{\alpha,\beta} \).

In practice, we only measure some values. In reality, we only measure displacements and forces at some locations – i.e., we know only some values \( \varepsilon_{\beta} \). In this case, since both \( K_{\alpha,\beta} \) and some values \( \varepsilon_{\beta} \) are unknown, the corresponding system of equations becomes quadratic. After sufficiently many measurements, we can still uniquely determine \( K_{\alpha,\beta} \), but the reconstruction is more complex.

What we prove. How more? In this talk, we prove that the corresponding reconstruction problem is, in general, NP-hard.
