## 1. Overview

- In many practical situations, there is a need to combine interval and probabilistic uncertainty.
- The need for such a combination leads to two types of problems:
  - how to process the given combined uncertainty, and
  - how to gauge the amount of uncertainty and – a related question – how to best decrease this uncertainty.
- In our research, we concentrate on these two types of problems.
- In this talk, we present two examples that illustrate how the corresponding problems can be solved.

## 2. General Problem of Data Processing under Uncertainty

- *Indirect measurements*: way to measure  $y$  that are are difficult (or even impossible) to measure directly.
- *Idea*:  $y = f(x_1, \dots, x_n)$

- *Problem*: measurements are never 100% accurate:  $\tilde{x}_i \neq x_i$  ( $\Delta x_i \neq 0$ ) hence

$$\tilde{y} = f(\tilde{x}_1, \dots, \tilde{x}_n) \neq y = f(x_1, \dots, y_n).$$

- *Question*: what are bounds on  $\Delta y \stackrel{\text{def}}{=} \tilde{y} - y$ ?

### 3. Probabilistic and Interval Uncertainty

- *Traditional approach:* we know probability distribution for  $\Delta x_i$  (usually Gaussian).
- *Where it comes from:* calibration using standard ML.
- *Problem:* calibration is not possible in:
  - fundamental science
  - manufacturing
- *Solution:* we know upper bounds  $\Delta_i$  on  $|\Delta x_i|$  hence

$$x_i \in [\tilde{x}_i - \Delta_i, \tilde{x}_i + \Delta_i].$$

## 4. Interval Computations: A Problem

- *Given:* an algorithm  $y = f(x_1, \dots, x_n)$  and  $n$  intervals  $\mathbf{x}_i = [\underline{x}_i, \bar{x}_i]$ .
- *Compute:* the corresponding range of  $y$ :  
$$[\underline{y}, \bar{y}] = \{f(x_1, \dots, x_n) \mid x_1 \in [\underline{x}_1, \bar{x}_1], \dots, x_n \in [\underline{x}_n, \bar{x}_n]\}.$$
- *Fact:* NP-hard even for quadratic  $f$ .
- *Challenge:* when are feasible algorithm possible?
- *Challenge:* when computing  $\mathbf{y} = [\underline{y}, \bar{y}]$  is not feasible, find a good approximation  $\mathbf{Y} \supseteq \mathbf{y}$ .

## 5. Interval Arithmetic: Foundations of Interval Techniques

- *Problem:* compute the range

$$[\underline{y}, \bar{y}] = \{f(x_1, \dots, x_n) \mid x_1 \in [\underline{x}_1, \bar{x}_1], \dots, x_n \in [\underline{x}_n, \bar{x}_n]\}.$$

- *Interval arithmetic:* for arithmetic operations  $f(x_1, x_2)$  (and for elementary functions), we have explicit formulas for the range.
- *Examples:* when  $x_1 \in \mathbf{x}_1 = [\underline{x}_1, \bar{x}_1]$  and  $x_2 \in \mathbf{x}_2 = [\underline{x}_2, \bar{x}_2]$ , then:
  - The range  $\mathbf{x}_1 + \mathbf{x}_2$  for  $x_1 + x_2$  is  $[\underline{x}_1 + \underline{x}_2, \bar{x}_1 + \bar{x}_2]$ .
  - The range  $\mathbf{x}_1 - \mathbf{x}_2$  for  $x_1 - x_2$  is  $[\underline{x}_1 - \bar{x}_2, \bar{x}_1 - \underline{x}_2]$ .
  - The range  $\mathbf{x}_1 \cdot \mathbf{x}_2$  for  $x_1 \cdot x_2$  is  $[\underline{y}, \bar{y}]$ , where
$$\underline{y} = \min(\underline{x}_1 \cdot \underline{x}_2, \underline{x}_1 \cdot \bar{x}_2, \bar{x}_1 \cdot \underline{x}_2, \bar{x}_1 \cdot \bar{x}_2);$$
$$\bar{y} = \max(\underline{x}_1 \cdot \underline{x}_2, \underline{x}_1 \cdot \bar{x}_2, \bar{x}_1 \cdot \underline{x}_2, \bar{x}_1 \cdot \bar{x}_2).$$
- The range  $1/\mathbf{x}_1$  for  $1/x_1$  is  $[1/\bar{x}_1, 1/\underline{x}_1]$  (if  $0 \notin \mathbf{x}_1$ ).

## 6. Straightforward Interval Computations: Example

- *Example:*  $f(x) = (x - 2) \cdot (x + 2)$ ,  $x \in [1, 2]$ .
- How will the computer compute it?
  - $r_1 := x - 2$ ;
  - $r_2 := x + 2$ ;
  - $r_3 := r_1 \cdot r_2$ .
- *Main idea:* perform the same operations, but with *intervals* instead of *numbers*:
  - $\mathbf{r}_1 := [1, 2] - [2, 2] = [-1, 0]$ ;
  - $\mathbf{r}_2 := [1, 2] + [2, 2] = [3, 4]$ ;
  - $\mathbf{r}_3 := [-1, 0] \cdot [3, 4] = [-4, 0]$ .
- *Actual range:*  $f(\mathbf{x}) = [-3, 0]$ .
- *Comment:* this is just a toy example, there are more efficient ways of computing an enclosure  $\mathbf{Y} \supseteq \mathbf{y}$ .

## 7. Combining Interval and Probabilistic Uncertainty

- *Situation*: in some cases, in addition to the bounds on each variables, we have partial information about its probability distribution.
- *Problem*: there are many ways to represent a probability distribution.
- *Idea*: look for an objective.
- *Objective*: make decisions  $E_x[u(x, a)] \rightarrow \max a$ .
- *Analysis*: for smooth  $u(x)$ , we have

$$u(x) = u(x_0) + (x - x_0) \cdot u'(x_0) + \frac{1}{2} \cdot (x - x_0)^2 \cdot u''(x_0) + \dots$$

so

$$E[u(x)] = u(x_0) + E[x - x_0] \cdot u'(x_0) + \frac{1}{2} \cdot E[(x - x_0)^2] \cdot u''(x_0) + \dots$$

- *Conclusion*: we must know moments to estimate  $E[u]$ .

## 8. Extension of Interval Arithmetic to Probabilistic Case: Successes

- *Easy cases*:  $+$ ,  $-$ , product of independent  $x_i$ .
  - *Example of a non-trivial case*: multiplication  $y = x_1 \cdot x_2$ , when we have no information about the correlation:
    - $\underline{E} = \max(p_1 + p_2 - 1, 0) \cdot \bar{x}_1 \cdot \bar{x}_2 + \min(p_1, 1 - p_2) \cdot \bar{x}_1 \cdot \underline{x}_2 + \min(1 - p_1, p_2) \cdot \underline{x}_1 \cdot \bar{x}_2 + \max(1 - p_1 - p_2, 0) \cdot \underline{x}_1 \cdot \underline{x}_2$ ;
    - $\bar{E} = \min(p_1, p_2) \cdot \bar{x}_1 \cdot \bar{x}_2 + \max(p_1 - p_2, 0) \cdot \bar{x}_1 \cdot \underline{x}_2 + \max(p_2 - p_1, 0) \cdot \underline{x}_1 \cdot \bar{x}_2 + \min(1 - p_1, 1 - p_2) \cdot \underline{x}_1 \cdot \underline{x}_2$ ,
- where  $p_i \stackrel{\text{def}}{=} (E_i - \underline{x}_i) / (\bar{x}_i - \underline{x}_i)$ .

## 9. First Result

- *Problem:* the above expression is computationally complicated.
- *New result:* new, equivalent, more computationally efficient expressions for  $\underline{E}$  and  $\overline{E}$ :

$$\underline{E} = E_1 \cdot E_2 - \min((E_1 - \underline{x}_1) \cdot (E_2 - \underline{x}_2), (\overline{x}_1 - E_1) \cdot (\overline{x}_2 - E_2));$$

$$\overline{E} = E_1 \cdot E_2 + \min((E_1 - \underline{x}_1) \cdot (\overline{x}_2 - E_2), (\overline{x}_1 - E_1) \cdot (E_2 - \underline{x}_2)).$$

## 10. Taking Correlation into Account: A Problem

- *Fact:* the range of  $E[x_1 \cdot x_2]$  depends on the ranges of  $E[x_i]$  and on the correlation between the  $x_i$ .
- *Previously covered:*
  - case when  $x_1$  and  $x_2$  are independent, and
  - case when we have no information about their correlation.
- *Practical situation:* sometimes, we know the interval  $[\underline{\rho}, \bar{\rho}]$  of possible values of the correlation  $\rho$ :

$$\rho(x_1, x_2) \stackrel{\text{def}}{=} \frac{E[x_1 \cdot x_2] - E_1 \cdot E_2}{\sigma_1 \cdot \sigma_2}.$$

- *Question:* what is the resulting range of  $E[x_1 \cdot x_2]$ ?

## 11. Taking Correlation into Account: First Result

- *Given:*
  - $[\underline{x}_1, \bar{x}_1]$  and  $[\underline{x}_2, \bar{x}_2]$  are given intervals,
  - $E_1 \in [\underline{x}_1, \bar{x}_1]$  and  $E_2 \in [\underline{x}_1, \bar{x}_1]$  are given numbers, and
  - $\rho$  is a given number.
- *Find:* the range  $[\underline{E}, \bar{E}]$  of possible values  $E[x_1 \cdot x_2]$  for all possible distributions for which:
  - $x_1$  is located in  $[\underline{x}_1, \bar{x}_1]$ , and  $x_2$  is located in  $[\underline{x}_2, \bar{x}_2]$ ;
  - $E[x_1] = E_1$ , and  $E[x_2] = E_2$ ; and
  - $\rho[x_1, x_2] = \rho$ .
- *Solution:*
  - for  $\rho \geq 0$ :  $[\underline{E}, \bar{E}] = [E_1 \cdot E_2, E_1 \cdot E_2 + \rho \cdot \sigma]$ ;
  - for  $\rho \leq 0$ :  $[\underline{E}, \bar{E}] = [E_1 \cdot E_2 + \rho \cdot \sigma, E_1 \cdot E_2]$ .

## 12. Taking Correlation into Account: Second Result

- *Given:*
  - $[\underline{x}_1, \bar{x}_1]$  and  $[\underline{x}_2, \bar{x}_2]$  are given intervals;
  - $E_1 \in [\underline{x}_1, \bar{x}_1]$  and  $E_2 \in [\underline{x}_1, \bar{x}_1]$  are given numbers;
  - $[\underline{\rho}, \bar{\rho}]$  is a given interval.
- *Find:* the range  $[\underline{E}, \bar{E}]$  of possible values  $E[x_1 \cdot x_2]$  for all possible distributions for which:
  - $x_1$  is located in  $[\underline{x}_1, \bar{x}_1]$ , and  $x_2$  is located in  $[\underline{x}_2, \bar{x}_2]$ ;
  - $E[x_1] = E_1$ , and  $E[x_2] = E_2$ ; and
  - $\rho[x_1, x_2] \in [\underline{\rho}, \bar{\rho}]$ .
- *Solution:*
  - for  $0 \leq \underline{\rho}$ :  $[\underline{E}, \bar{E}] = [E_1 \cdot E_2, E_1 \cdot E_2 + \bar{\rho} \cdot \sigma]$ ;
  - for  $\bar{\rho} \leq 0$ :  $[\underline{E}, \bar{E}] = [E_1 \cdot E_2 + \underline{\rho} \cdot \sigma, E_1 \cdot E_2]$ ;
  - for  $\underline{\rho} \leq 0 \leq \bar{\rho}$ :  $[\underline{E}, \bar{E}] = [E_1 \cdot E_2 + \underline{\rho} \cdot \sigma, E_1 \cdot E_2 + \bar{\rho} \cdot \sigma]$ .

## 13. Second Problem: How to Measure Loss of Privacy

- *Measuring loss of privacy is important:* to compare different privacy protection schemes.
- *Natural idea:* gauge the loss of privacy by the resulting worst-case financial loss.
- *Example:* the effect of a person's blood pressure  $x$  on this person's insurance payments:

- let  $f(x)$  be average medical expenses for a person with blood pressure  $x$ ; let  $\alpha$  be investment profit;
- in case of privacy, the insurance payments are

$$r = (1 + \alpha) \cdot E[f(x)];$$

- if a person's blood pressure is revealed as  $x_0$ , with  $f(x_0) > E[f(x)]$ , then the payments are higher:

$$r_0 = (1 + \alpha) \cdot f(x_0) > r = (1 + \alpha) \cdot E[f(x)].$$

## 14. Loss of Privacy: Main Result

- *Situation:* we knew that  $x \in [L, U]$ , now we learned that  $x \in [l, u] \subseteq [L, U]$ .
- *Description:* we knew that  $P \in \mathcal{P}$  (all distributions located on  $[L, U]$ ), now we know that  $P \in \mathcal{Q}$  (all distributions located on  $[l, u]$ ).
- *Definition:* let  $M > 0$  be a real number. The *amount of privacy*  $A(\mathcal{P})$  related to  $\mathcal{P}$  is the largest possible value of the difference  $F(x_0) - \int \rho(x) \cdot F(x) dx$  over:
  - all possible values  $x_0$ ,
  - all possible probability distributions  $\rho \in \mathcal{P}$ , and
  - all possible f-s  $F(x)$  for which  $|F'(x)| \leq M$  for all  $x$ .
- *Result:* the *relative loss of privacy*  $\frac{A(\mathcal{P}) - A(\mathcal{Q})}{A(\mathcal{P})}$  is equal to  $1 - \frac{u - l}{U - L}$ .
